Dear Sir/Madam,

Dear Patients,

The Department of Paraplegia, Orthopaedic Technology and Spine Surgery is divided into three sections.

The largest section provides treatment for patients with paraplegia caused by accidents and diseases of the spinal cord and the spinal column. Treatment is performed by a specialised multi-professional team of nursing staff, physical therapists, occupational therapists, psychologists, social workers and physicians. The department offers a neurology consultation including urodynamic testing and also collaborates closely with the University Department of Urology Tübingen. The acute treatment of paraplegics aims to enable patients to have the highest possible level of independence in living a self-determined life as well as to return to their personal and, whenever possible, also professional environment.

At the same time, lifelong follow-up care includes both outpatient and inpatient treatment of complications resulting from paraplegia, such as decubitus ulcers, spasticity and others.

Being part of a trauma hospital, the Spine Surgery section naturally focuses on spinal injuries, utilising a full range of common surgical techniques to treat injuries of the cervical, thoracic and lumbar spine.

Both intensive non-surgical and surgical treatment is provided employing common stabilisation and decompression techniques for the wide variety of degenerative spinal conditions and chronic back pain.

The Orthopaedic Technology section focuses mainly on the treatment of patients following amputations of the lower extremities, providing prostheses and orthopaedic shoes in close collaboration with the orthopaedic technician and the orthopaedic shoemaker. Corrective surgery on the affected extremities is also performed whenever necessary.

Kind regards,

Andreas Badke
Head of the Department of Paraplegia, Orthopaedic Technology and Spine Surgery
Deputy Medical Director
