Dear Sir/Madam,

Dear Patients,

The face is the mirror of one’s personality and is individually distinctive for every human being. Apart from congenital and developmental disorders, changes in the form and function of the face may be caused by accidents, inflammations or tumours.

Oral and maxillofacial surgery and plastic surgery is the only surgical discipline to require a full medical and dental degree followed by seven years of speciality training, making it highly specialised in the treatment of conditions affecting the face.

Our clinic employs the most advanced diagnostic procedures in a tertiary-care hospital. We offer our patients the full range of non-surgical and surgical methods. We are committed to restoring the highest level of function and appearance in all surgeries, with the patient always being the focus of our efforts.

Kind regards,

Siegmar Reinert
Director of the Clinic for Oral and Maxillofacial Surgery and Plastic Surgery of BG Klinik Tübingen
Medical Director of the Clinic for Oral and Maxillofacial Surgery at University Hospital Tübingen

- Surgery for deformities (cleft lips and palates)
- Traumatology
- Tumour surgery
- Bisphosphonate-associated osteonecrosis of the jaw
- Traumatology
- Tumour surgery

Range of services

Facial restoration after accidents and late effects of accidents
The face is the most personal and distinctive feature of a person. The primary objective in the treatment of facial injuries is to restore form and function.

Centre for facial deformities
The birth defect of cleft lip and cleft palate and other rare facial deformities as well as haemangiomas are treated in our specialised centre on an interdisciplinary basis. We are devoted to providing consultation and treatment by an experienced team of physicians.

Tumour treatment in the face and oral cavity
The treatment of benign and malignant tumours in the area of the face, jaw bones and oral cavity is performed at our clinic within the first centre for head and neck tumours to be certified by the German Cancer Society. We employ the most advanced methods of plastic reconstructive surgery.

Jaw deformities
Jaw deformities can not only lead to malocclusion, but may also cause chewing and mandibular joint problems. This is why surgical correction is not just performed for the sake of physical appearance, but is aimed at improving both function and alignment.

Ridge augmentation and dental implants
Tooth loss commonly leads to jawbone atrophy, which is why dental implant surgery can often be performed only in combination with bone augmentation procedures. Depending on the diagnosis, all available methods including autologous bone grafting are offered as outpatient or, optionally, inpatient services.

Aesthetic facial surgery
Both ageing and deviations in form can affect facial aesthetics. It is essential to provide objective and individualised advice on all available corrective options based on a thorough examination of the entire face. The services offered include Botox, collagen, laser, exfoliation, rhinoplasty and blepharoplasty as well as facelift surgery.
